Oil Pump System

Operation Diagram

The oil pump is the vital component that provides the circulation of oil which cools, cleans and lubricates internal engine components. In some engines, the oil pump also provides hydraulic power to valve lifters and valve timing components. Driven by crankshaft power, the pump creates suction to draw oil from the oil pan through the strainer. The suction by the pump creates the pressure where oil is driven through the oil filter, oil cooler, internal moving parts, provide hydraulic power, then collected back into the oil pan.

Drive Systems

Various systems are utilized to transfer power from the crankshaft to the oil pump. The type of drive system influences the configuration and location of the oil pump.

Gear Drive
(Integral Unit with Gear Case)

Structure and Components

The basic structure of the oil pump consists of a sprocket (drive rotor) which revolves within a housing (driven rotor). The complex geometry of the rotor and the housing creates suction. Depending on the type of oil pump drive system, the rotor can receive power through a shaft that is connected to a pulley, a gear, a sprocket or directly into the crankshaft. When the rotor is revolved, oil is drawn in from the suction port and expelled into the discharge port. This process creates oil pressure to supply oil to the moving components of the engine. A relief valve is strategically configured in between the ports to prevent excessive pressure build-up and maintain optimal operating oil pressure.

Oil Pump Configuration

Chain Drive / Gear Drive

Direct Crankshaft Drive

Relief Valve Configuration

The relief valve is configured to prevent excessive oil pressure. The excess pressure along the discharge port compresses the relief valve spring to open the valve, relieving pressure by re-circulating the oil back into the suction port.

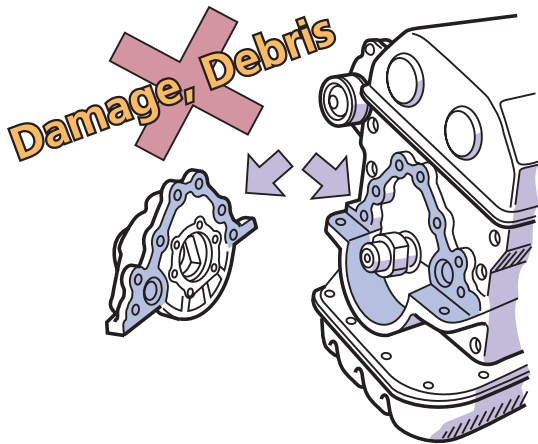

Installation Procedure

CAUTION!

Failure to follow recommended procedures may cause engine failure and injury. Always consult the manufacturer's vehicle specific service manual for reference.

1

Remove old pump, gaskets and foreign materials left on the mounting surface. Thoroughly clean with non-abrasive solvent. Confirm that the mounting surfaces are free of damage, deformation, and debris.

Damage, deformation, and debris on mounting surfaces may cause seal malfunction which will create oil leakage and lower oil pressure.

2

Always use engine oil to lubricate the sliding and rotating components of the oil pump when installing, disassembling, or cleaning.

Lubricating surfaces will prevent pump seizure and suction failure.

3

Ensure that there are no contaminants or debris in the pump before installation.

Contaminants and debris will cause damage to rotors. Consequently, improper valve operations and abnormal pressure may occur.

4

Check for damage, deformation, and debris along the oil seal mounting areas. Install oil seal and confirm proper seating.

Improper seating will cause oil leakage and loss of oil pressure.

CAUTION! Failure to follow recommended procedures may cause engine failure and injury. Always consult the manufacturer's vehicle specific service manual for reference.

5

Always use new O-rings and gaskets when installing an oil pump. Ensure the O-ring does not pinch between mounting surfaces during installation.

Pinched oil rings will cause oil leaks and lower oil pressure.

6

Oil pump rotors are precision components that require care in handling. Take extreme caution when inspecting and installing.

Damaged rotors will cause improper rotation and incorrect oil pressure.

7

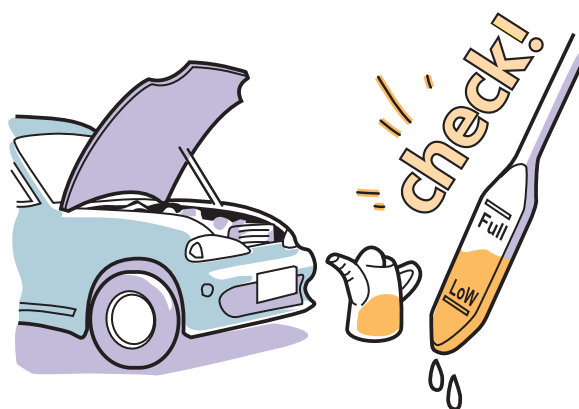

Install the oil pump in a diagonal (star) pattern. Always follow the manufacturer's vehicle specific recommended torque tools, procedures, and specifications.

Following correct procedures prevents leakage from the mounting surface, oil pump body, and body fractures caused by over-torque.

8

After the installation of the oil pump, start and idle the engine until operating temperature has been reached. Stop the engine and check the oil level. Add oil to proper level.

Circulating the oil after replacing the pump bleeds trapped air within the engine. Adding oil to the proper level prevents engine damage and ensures optimal performance.

Product Line-Up!

AISIN, known world-wide as a leader in clutch technology, has other OE Matched quality parts available. Check out our other product lines for your aftermarket needs.

IMPORTANT NOTICE

The purpose of this catalog is to furnish our customers with as complete a listing of their oil pump parts requirements as possible.

All listings, applications or interchanges contained in this catalog are based on the latest information available at the time of printing. Every effort has been made to ensure that the information contained in this catalog is correct, but we do not assume any responsibility for errors which may occur.

All references to manufactures names or part numbers are only used as a guide when ordering oil pump parts.
